Experiment No.: 9

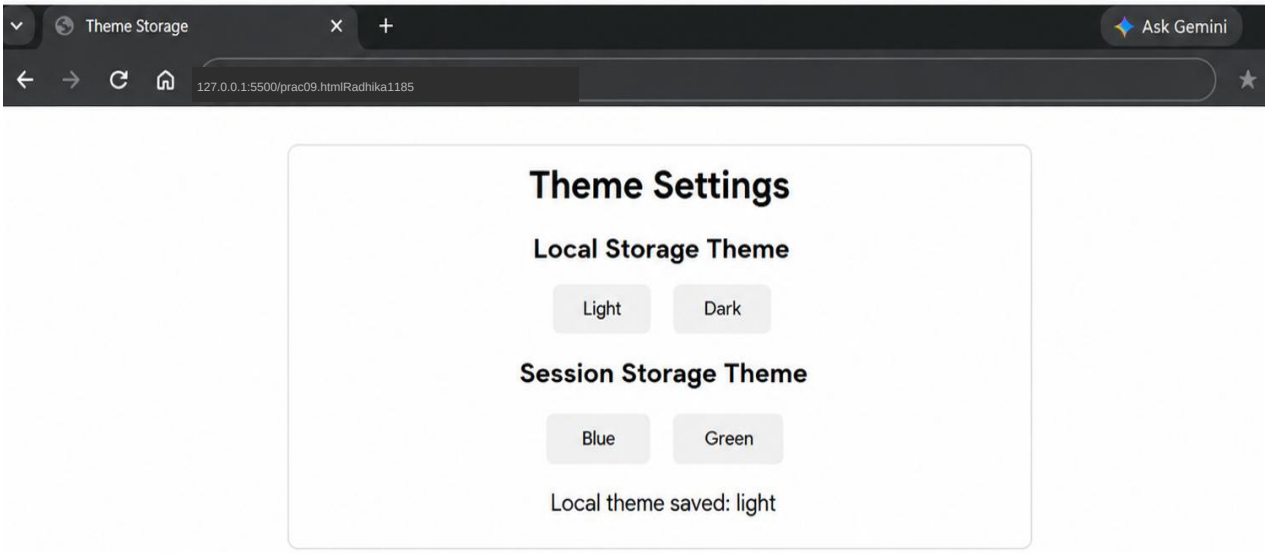

1. **Title:** Implementation of localStorage and sessionStorage to Save User Preferences

2. **Software/Tools Required:** Visual Studio Code (VS Code), web browser, HTML, JavaScript.

3. **Theory:** Web Storage is a feature of JavaScript that allows websites to store data in the user's browser. It provides two main storage methods: localStorage and sessionStorage. localStorage is used to store data that remains available even after closing and reopening the browser. In this practical, localStorage is used to save the user's theme preference, such as light mode or dark mode. sessionStorage is used to store data for a particular browser session. In this practical, it is used to save the user's name. The stored data remains available while the session continues and is generally removed when the browser tab or session ends. JavaScript methods such as setItem() and getItem() are used to save and retrieve data from storage. The classList.toggle() method is used to change the theme dynamically.

4. **Output**

5.Conclusions: In this practical, we successfully implemented localStorage and sessionStorage to save user preferences. localStorage was used to store the theme settings, while sessionStorage was used to store the username. The theme was changed dynamically using JavaScript, and stored preferences were retrieved when the page was reloaded. This practical helped us understand browser storage and its use in web development.
