Experiment No.: 10

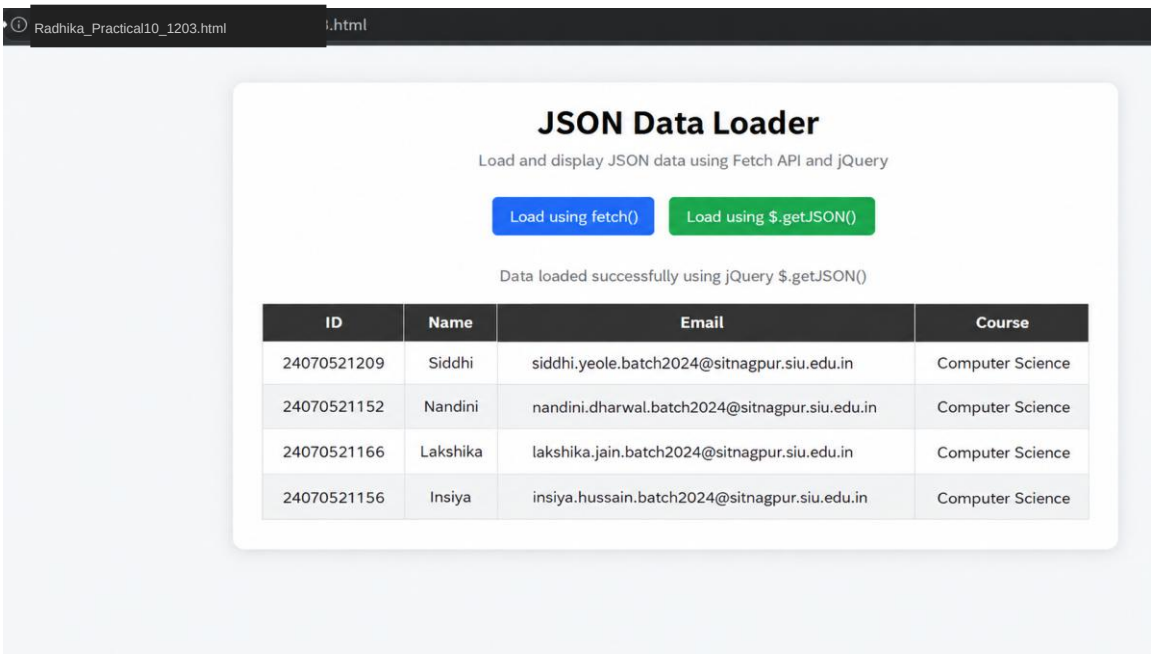

1. **Title:** Load and display JSON data using fetch() and jQuery $.getJSON(); render results dynamically in a table.

2. **Software/Tools Required:** HTML, CSS , JavaScript ,VS Code,jQuery 3.7.1 .

3. **Theory:** JSON (JavaScript Object Notation) is a lightweight format used for storing and exchanging structured data. In this practical, JSON data containing student details is loaded and displayed dynamically in an HTML table.The Fetch API is used to retrieve JSON data asynchronously using fetch(), followed by response.json() to convert the response into JavaScript objects. The jQuery $.getJSON() method provides another simple way to load JSON data asynchronously. After receiving the data, JavaScript dynamically creates table rows and inserts them into the HTML table using DOM manipulation.

4. Output:

5.Result/Conclusion: The JSON data was successfully loaded using both the Fetch API and jQuery $.getJSON(). The retrieved student information was dynamically rendered in an HTML table. Thus, asynchronous JSON data loading and dynamic table generation were successfully implemented.
